JAHNAVI GAMING ARENA

Website Development Report

Website Description

Jahnavi Gaming Arena is a gaming community website created to present popular games, featured player profiles, tournaments, leaderboards and gaming news in one place. The home page welcomes visitors with the message “Play Together. Compete Together.” It also displays gaming statistics and game cards so that visitors can quickly explore the available content. The design uses a dark gaming theme with blue highlights to give the website a modern gaming-arena appearance.

Technologies Used

HTML is used to organise the page content and create sections, headings, navigation links, text and buttons. CSS is used to style the page, control spacing and alignment, create the dark colour theme, and arrange the navigation bar and content cards.

Report Contents

- HTML Code – page structure and content
- CSS Code – visual design and layout
- Output – final website displayed in the browser

1. HTML CODE

The HTML file (game.html) provides the basic structure of the Jahnavi Gaming Arena website. It begins with the HTML document declaration and includes the page metadata, title and link to the external stylesheet named game.css.

The navigation area is created using semantic elements such as <header> and <nav>. A logo and navigation links are placed inside it. The hero section introduces the gaming community with a welcome message, a main heading, a short description and an “Explore Games” button. The screenshot also shows the beginning of the gaming statistics section.

HTML elements used include <header>, <nav>, <ul>, <li>, <a>, <section>, , , <h1> and <p>. Classes and IDs are added to elements so that they can be styled and linked to other sections of the page.

2. CSS CODE

The CSS file (game.css) controls the appearance and layout of the website. It applies a dark background, readable text colours and blue accent colours to match the gaming theme.

The body rule sets the font family, background colour, text colour and line spacing. The header is styled with a dark background and sticky positioning so that the navigation bar remains at the top while the visitor scrolls. Flexbox is used in the navigation bar to align the logo and links neatly. The logo and navigation links receive separate font, colour and spacing styles, while hover styling changes the link colour when the pointer is placed over a link.

CSS properties visible in the screenshot include background, color, font-family, line-height, padding, font-size, font-weight, position, top, z-index, border-bottom, display, justify-content, align-items, gap and transition. These properties improve readability, alignment and the overall visual presentation.

3. OUTPUT

The following screenshot shows the completed Jahnavi Gaming Arena home page running in a web browser using the local development server. The top navigation bar displays the website logo and links to sections such as Home, Games, Players, Tournaments, Leaderboard and News.

Below the navigation bar, the hero banner presents the welcome message and the “Play Together. Compete Together.” heading with an Explore Games button. A statistics strip displays the number of featured games, player profiles, community events and the 24/7 gaming community message. The Popular Games section presents game cards with images and short descriptions, followed by the Featured Player Profiles section. The final output demonstrates how HTML content and CSS styling work together to create a clear, organised and attractive gaming website.
