WEB PAGE 01

JAHNAVI LIBRARY & LEARNING CENTRE

Website Development Report

Website Description

Jahnavi Library & Learning Centre is a website designed to introduce a library and help visitors explore its books and learning resources. The home page welcomes users with the message “Discover the World Through Books” and encourages them to explore the collection. The website also presents information about the library, its available books, registered members, book categories and reading access. Its purpose is to make library information easy to understand and help visitors find books according to their interests.

Technologies Used

HTML (HyperText Markup Language) is used to organise the website content, including the navigation menu, headings, paragraphs, links and page sections. CSS (Cascading Style Sheets) is used to design the page by applying colours, fonts, spacing, alignment, backgrounds and layout styles.

Report Contents

- HTML Code – structure and content of the library website
- CSS Code – styling, colours and page layout
- Output – final website displayed in the browser

1. HTML CODE

The HTML file (library.html) defines the structure and content of the Jahnavi Library website. The document includes the HTML declaration, language setting, character encoding, viewport information, page title and a link to the external stylesheet named library.css.

The navigation bar is created using <header> and <nav>. The library logo is placed in a , while an unordered list (<ul>) with list items (<li>) and anchor tags (<a>) provides links to Home, About Us, Categories, Books, Library Rules and Contact. The home section uses <section>, headings, paragraphs and a button-style link to introduce the library.

The About section uses a heading and paragraph to explain the purpose of the library. A statistics area uses elements to display details such as the number of books, registered members, book categories and reading access. Classes and IDs are included to identify sections and apply CSS styling or navigation links.

2. CSS CODE

The CSS file (library.css) controls the visual appearance of the library website. The universal selector (*) resets the default margin and padding and applies border-box sizing. The body rule sets the Arial font, page background colour, text colour and line spacing.

The section rule adds spacing around the page sections. The h2 and subtitle rules control text alignment, colour, font size and spacing. The header is given a dark blue background and sticky positioning, which keeps the navigation area at the top while scrolling. Flexbox properties such as display: flex, justify-content and align-items arrange the logo and navigation links in a neat horizontal layout.

Other CSS properties shown include background, color, font-family, line-height, padding, font-size, margin-bottom, position, top, z-index, list-style, gap, text-decoration and transition. Together, these styles create a consistent design, improve readability and make the website easier to navigate.

3. OUTPUT

The screenshot below shows the completed Jahnavi Library & Learning Centre website running in a web browser through the local development server. At the top, the navigation bar displays the library name and links to the main sections of the website.

The hero banner contains a library background image, a welcome message, the heading “Discover the World Through Books” and an Explore Books button. The About Our Library section introduces the centre and displays statistics for books available, registered members, book categories and reading access. The Explore Book Categories section presents different subjects, including Technology, Science, Mathematics, Fiction, History and Self-Development. The Our Book Collection section includes a search field, category and availability filters, and book cards with cover images and titles. This output demonstrates how the HTML structure and CSS design combine to create an organised and user-friendly library website.
