JAHNAVI TRAVELS

Website Development Report

Website Description

Jahnavi Travels is a travel website designed to help visitors explore destinations and discover holiday packages. The home page welcomes users with the message “Explore Beautiful Places, Make Beautiful Memories” and provides an Explore Packages button. Visitors can use the holiday search area to select a destination and trip duration. The website also introduces the travel service, highlights its benefits and displays popular destinations such as Goa, Manali, Kerala, Jaipur, Kashmir and Ooty. Its main purpose is to present travel information in a simple and organised way.

Technologies Used

HTML (HyperText Markup Language) is used to create the structure of the website, including the navigation menu, hero section, search form, headings, paragraphs, destination information and links. CSS (Cascading Style Sheets) is used to control the visual design, including colours, fonts, spacing, alignment, backgrounds and the layout of the different sections.

Report Contents

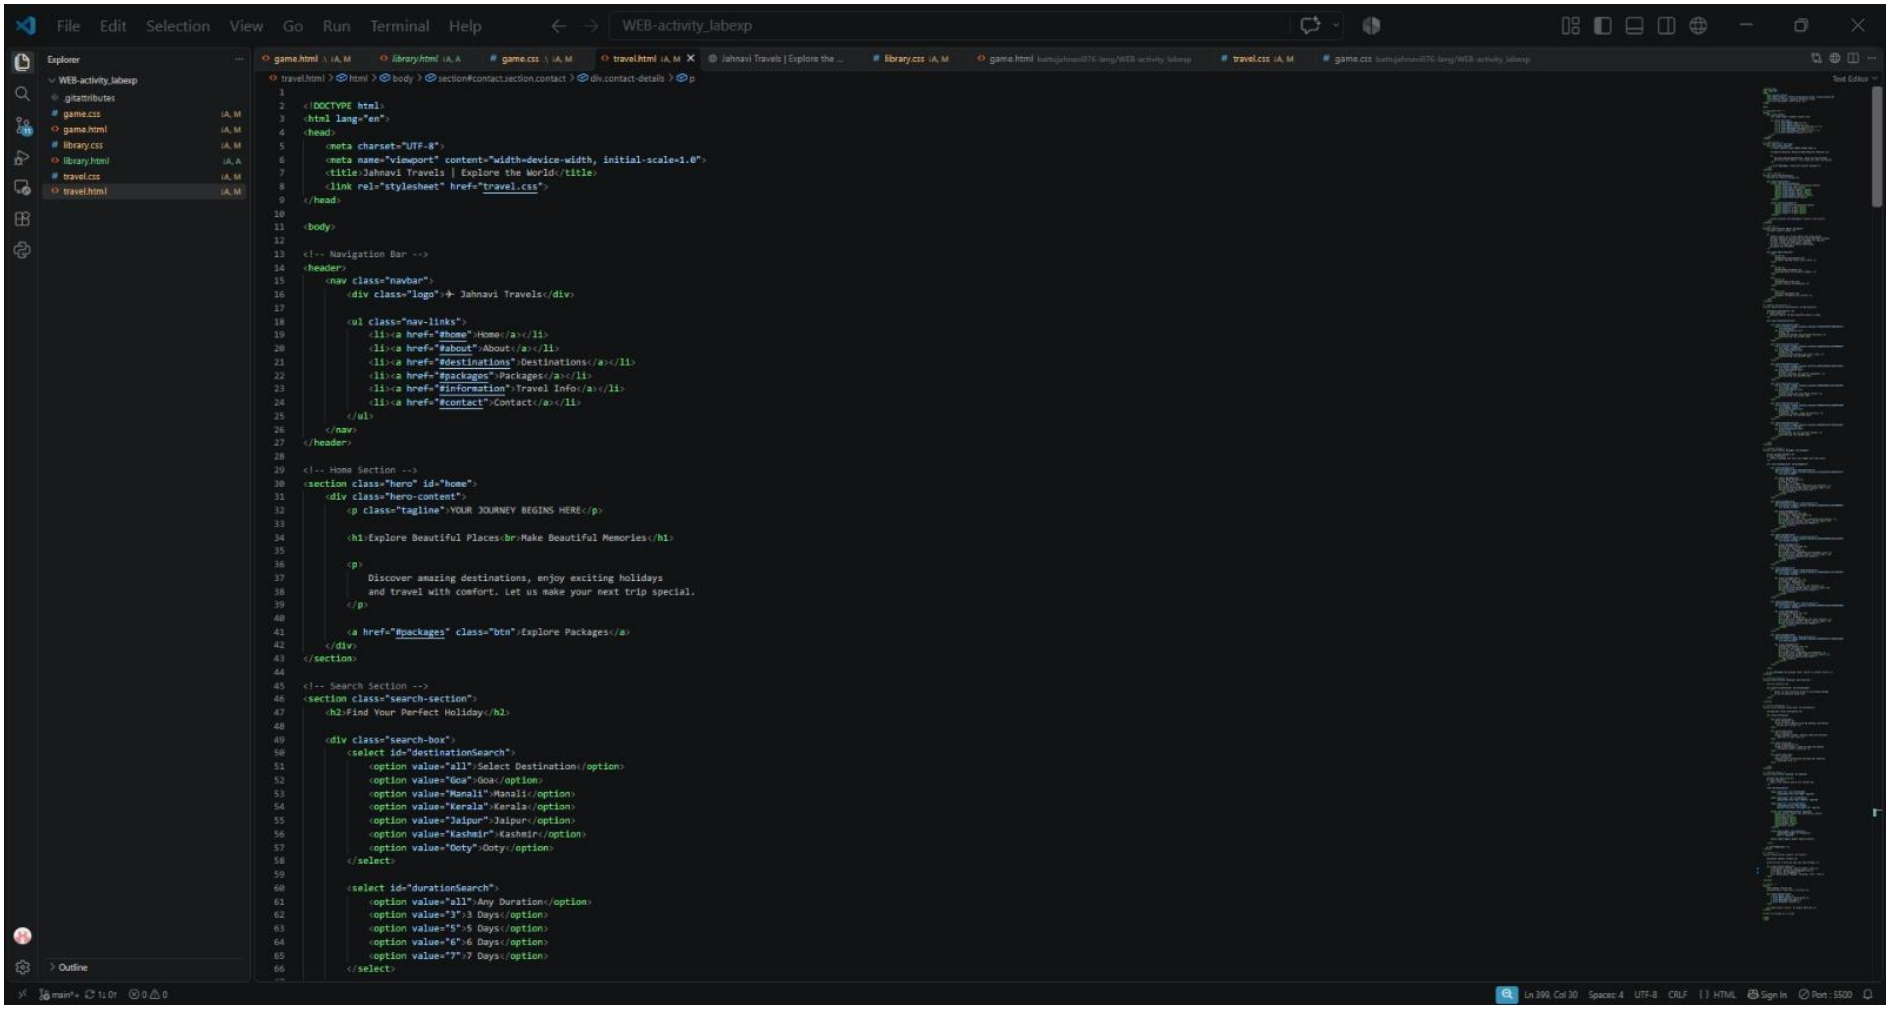

- HTML Code – structure and content of the travel website
- CSS Code – styling and layout of the website
- Output – final website displayed in the browser

1. HTML CODE

The HTML file (travel.html) defines the structure and content of the Jahnavi Travels website. It includes the document declaration, language, character encoding, viewport settings, page title and a link to the external stylesheet named travel.css.

The navigation area is built using <header> and <nav>. A logo is displayed inside a , and an unordered list (<ul>) with list items (<li>) and anchor tags (<a>) provides links to Home, About, Destinations, Packages, Travel Info and Contact. The home section uses a <section> element and a content to display a tagline, a main heading, a short paragraph and an Explore Packages link styled as a button.

The search section contains a heading and a search box with <select> controls. The destination menu includes options such as Goa, Manali, Kerala, Jaipur, Kashmir and Ooty. A second selection control allows visitors to choose a trip duration. These HTML elements organise the page and provide the basic controls for the travel search interface.

2. CSS CODE

The CSS file (travel.css) is used to style the travel website. The universal selector (*) resets the default margin and padding, applies border-box sizing and enables smooth scrolling. The body rule sets the Arial font, a light background colour, dark text and suitable line spacing.

The section rule adds spacing around each content section. The h2 and subtitle rules control heading alignment, font size, colour and bottom spacing. The header is given a blue background and sticky positioning so that the navigation bar stays at the top while the visitor scrolls. Flexbox properties such as display: flex, justify-content and align-items arrange the logo and navigation links horizontally.

Other visible CSS properties include background, color, font-family, line-height, padding, font-size, margin-bottom, position, top, z-index, gap and text-decoration. These properties help maintain consistent colours, improve readability and create a neat page layout.

3. OUTPUT

The screenshot below shows the Jahnavi Travels website running in a web browser through the local development server. The top navigation bar displays the website name and links to its main sections. The hero area introduces the website with the heading “Explore Beautiful Places, Make Beautiful Memories” and an Explore Packages button.

Below the hero area, the Find Your Perfect Holiday section provides destination and duration selection controls with a Search Trips button. The About Jahnavi Travels section explains the service and displays four feature cards: Beautiful Destinations, Affordable Packages, Comfortable Stays and Travel Assistance. The Popular Destinations section presents travel cards for Goa, Manali, Kerala, Jaipur, Kashmir and Ooty, with short descriptions and starting-price information. The output shows how the HTML structure and CSS styling work together to create an organised travel website that is easy for visitors to explore.
